System specification – Nexstep

System specs for Nexstep

Nexstep is always sold as a SaaS solution when considering hosting, our customers has no insight in how our power machines are configured. In a SaaS solution hosting is always included as part of the service and the customer is free from this responsibility.

Client specs for Nexstep

Since Nexstep runs in a Web browser (We recommend Google Chrome) it's mostly what Google sets as system requirements you'll need to follow.

However, as a general rule these would be recommended specs:

• CPU: Intel i5 9th Gen or higher/equivalent

• 8Gb RAM or more

• 20 GB available disk space

• Integrated Intel GPU or higher

• Network

Note: If the computer is to be used for more than just Nexstep/heavier load those programs that require a more heavy spec will take precedence
