

## Enable data control, integrity and transparency across your entire organization

### EG Global Data Management Advantages:

- Enable global data transparency and consistency.
- Work with one company-wide data source.
- Meet local requirements without sacrificing global data integrity.
- Drive operational efficiencies and boost productivity.
- Reduce errors from manual entry and double entry of data.
- Enable accurate analysis and reporting based on valid, company-wide business data.
- Simple and straightforward to set up and use.

**It can be challenging to strike a balance between the needs of local subsidiaries and the need for centralized data control. EG Global Data Management (GDM) for Dynamics 365 helps ensure transparency and consistency when working with business data across your organization, while still allowing for the requirements of individual companies. So you have the visibility, control and flexibility you need to be agile - without sacrificing data integrity.**

### **A one-company approach to global data management**

Managing data in a uniform way across your entire organization has many potential benefits. It can improve operational efficiency and business insight. But when you have local subsidiaries or locations with unique requirements, it can be difficult to control and use data in a uniform and efficient way.

With GDM, you can take a one-company approach to your data governance. The generic interface allows you to replicate data from one company to other companies in your ERP installation. You can determine centrally which information, settings, values and fields can be created, modified and deleted by local companies and which cannot, so you stay in full control.

### Meet global and local requirements

With GDM, you can decide which type of data each company in your organization has access to, and what they can do with it. For example, GDM can be set up so local manufacturing companies get only production-related data and local sales companies receive only sales-related items. You can also take local requirements, such as currency codes, VAT set-up and payment and delivery terms, into consideration by allowing these to be defined locally.

### Flexible and convenient data distribution options

Global data can be pushed to subsidiaries as soon as it is updated, manually when needed, or via batch jobs during off hours to optimise system performance. With GDM, you have full control over how and when data is distributed and to what degree it can be changed, deleted and updated by local subsidiaries. So you can meet local requirements while still running an efficient global organization.

### Steer your business with accurate, consistent global data

With consistent and valid business data across your business, you have a solid baseline for accurate global and subsidiary reporting. This, in turn, paves the way for more accurate planning, more efficient processes and better-informed business decisions.

### EG and Dynamics 365 – all you need from one experienced partner

Contact EG to hear how Global Data Management for Microsoft Dynamics 365 for Finance and Operations can enable data control, integrity and transparency across your business – or to discuss other business needs.
